Who is Sven Selberg

- > SCM Team lead @ Axis Communications

Common Structures

meta, links

- > Meta
 - No divergence between events ever.
- > links
 - Same type list, valid content differs.

Common “data” objects

- > SourceCodeChanged, SourceCodeSubmitted
 - gitIdentifier
 - hgIdentifier
 - svnIdentifier
 - vobs
- > ActivityStarted, TestCasestarted, TestSuiteStarted
 - liveLogs
- > ActivityFinished, TestCaseFinished, TestSuiteFinished
 - liveLogs
- > ActivityTriggered, TestCaseTriggered
 - triggers

Separate but equally named “data” objects

- > outcome
 - TestCaseFinished
 - TestSuiteFinished
 - ActivityFinished

Issues

Interpreting the specification

- > Less text, same spec
- > meta
 - 
 - 55% (2500 lines) markdown
- > Categories makes spec easier to comprehend
 - F.i. you only need to interpret the meta object once.

Implementation of event creators/handlers

- > Most environments Object/Type oriented
 - Code reuse
 - Adapting to new Eiffel versions
- > Type conflicts
 - ...

Type confusion (eiffel-graphql-api)

Query:

```
sourceChangeCreated(search: "{ 'data.gitIdentifier.commitId': 'ae64999f160ddfec29eaa2da77f6fc82b785ac20' }")
```

Response:

```
"data": {
  "sourceChangeCreated": {
    "edges": [
      {
        "node": {
          "data": {
            "sourceChangeCreatedGitIdentifier": {
              "commitId": "ae64999f160ddfec29eaa2da77f6fc82b785ac20"
            }
          }
        }
      }
    ]
  }
}
```

Disparate objects named the same

- > Same problem but the “other way around”

THANK YOU
