

Eiffel visualizations at Axis

Some ongoing activities at Axis.

Who am I?

Niklas Aronsson

- Works with tools at Axis.
- Have also worked at Ericsson/Lund with Eiffel visualizations (Hej Emil!).

Service: Eiffel Eye (working title)

A Graphical way to explore event relationships.

- Will be open sourced.
- Can be seen as a companion to the "eiffel-goer" event repo.

The problem it will solve

- Not feasible to use the Event Repo directly to verify an Eiffel event chain
- Especially for flows that may contain thousands of events.

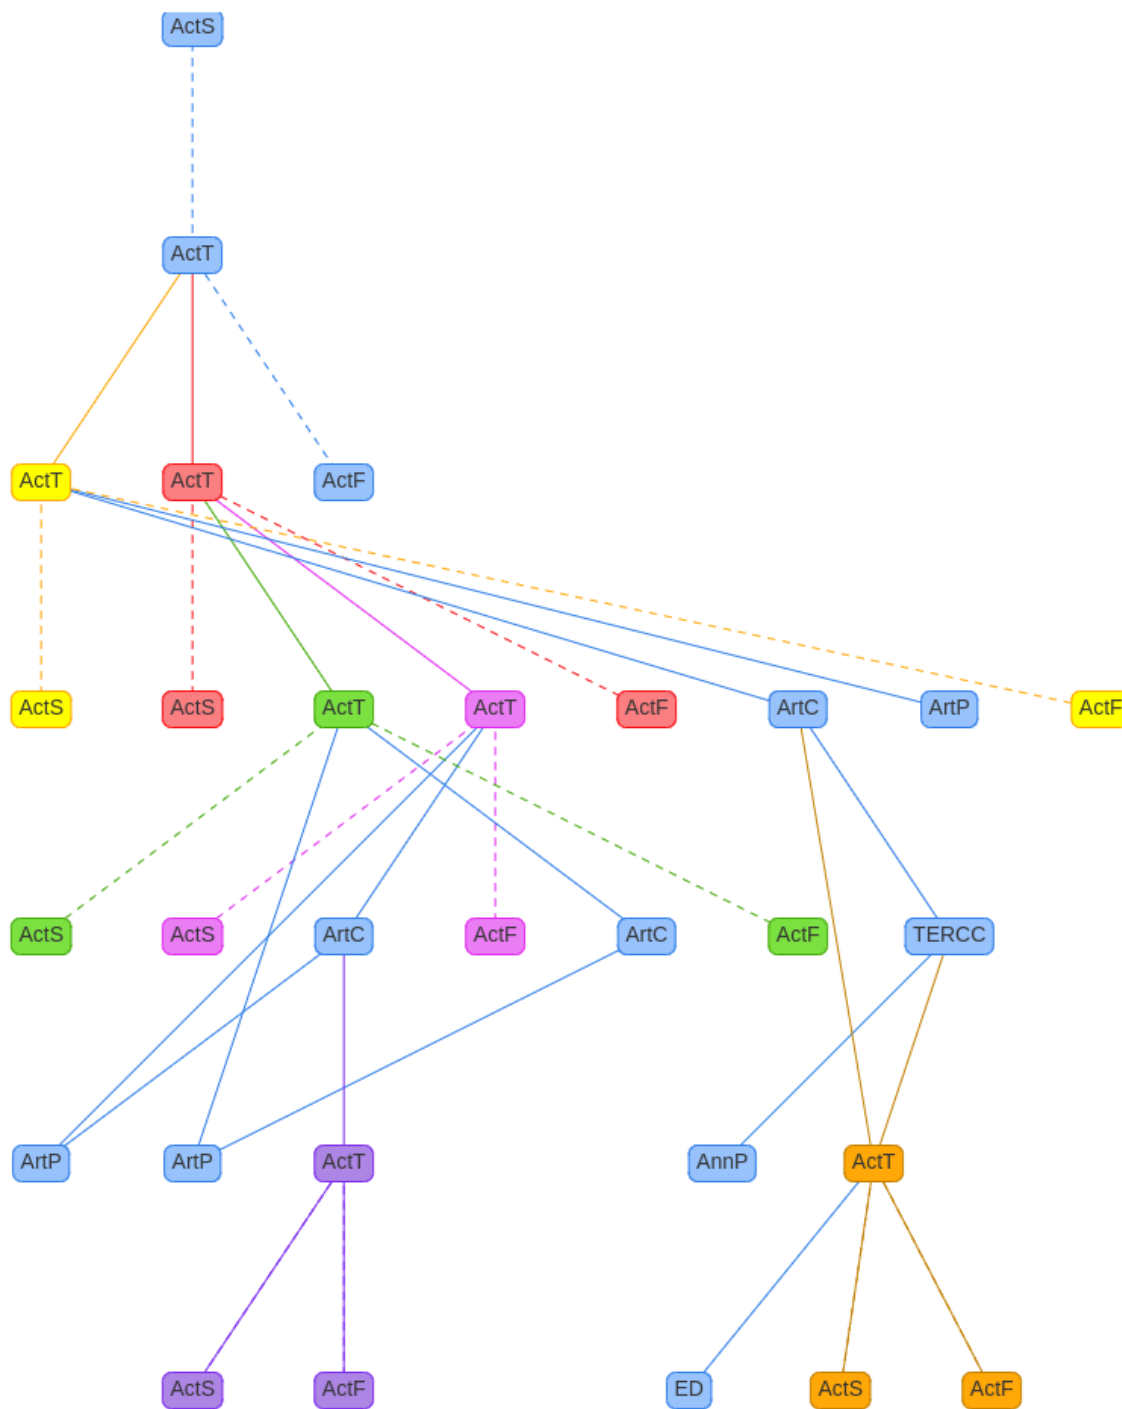

Event flows as network diagrams

Definition: NETWORK DIAGRAM

Network diagrams (also called Graphs) show interconnections between a set of entities. Each entity (event) is represented by a Node (or vertice). Connections between nodes are represented through links (or edges).

Using the Eiffel Eye

- Get an Event Id of an event in a flow you want to explore.
- Decide if you are interested in "upstream" or "downstream" events.
- The following example is using 205 events.

ActS 202

Availability of the Eiffel Eye

- Depends on the "eiffel-goer" Event Repo.
- Should be available after "eiffel-goer" is feature complete.
- The actual presentation may be different.

Follow My Commit at Axis

What we currently have available:

- A web based integration tool.
- Using "standard" rabbitmq messages from Gerrit and Jenkins.

Current plan

- Expand the commit information with new information.
- Use Eiffel as source while doing it.

Follow My Commit goals

- Expand current commit visualization with Eiffel sourced data.
- Look into replacing current data sources with Eiffel.
- Real time updates in the browser as the events are received.

Follow My Commit tech stack

Inspired by "VIDAC" (Ericsson inner source project)

- Service that collects Event data and stores it in relevant documents.
- Service between the database and browser.
- The eiffel backend is called in new parts of the "legacy" UI.

Follow My Commit status

Still missing key events to complete implementation. To be continued...
